FICTIONAL TEST DOCUMENT - NOT A REAL RESEARCH PAPER

Keywords: charging infrastructure; perceived price; UTAUT2; mediation

Abstract

This is a FICTIONAL document generated to test software. It is not a real study. This paper aims to investigate how charging infrastructure and perceived price shape intention to purchase electric vehicles.

1. Introduction

Few studies have examined the role of range anxiety in emerging markets. The study draws on the unified theory of acceptance and use of technology (UTAUT2).

2. Methodology

A questionnaire survey was conducted among consumers in India (n = 286) using purposive sampling. Multiple regression and mediation analysis using the PROCESS macro with bootstrapping were performed.

3. Results

Findings indicate that charging infrastructure positively influences purchase intention. Perceived risk mediates the relationship between perceived price and purchase intention.

4. Conclusions

Investment in charging infrastructure may raise purchase intention, according to this fictional analysis.

5. Future research

Further research could compare two-wheeler and four-wheeler buyers.
