FICTIONAL TEST DOCUMENT - NOT A REAL RESEARCH PAPER

Keywords: environmental concern; attitude; theory of planned behaviour; gender

Abstract

This is a FICTIONAL document generated to test software. It is not a real study. The objective of this study is to analyse the role of environmental concern in EV purchase intention.

1. Introduction

Research on the moderating role of gender remains underexplored. We extend the theory of planned behaviour with environmental concern.

2. Methodology

A cross-sectional survey of 350 respondents in Bengaluru, India was conducted using convenience sampling. Exploratory factor analysis and structural equation modelling (AMOS) were used.

3. Results

The results reveal that environmental concern has a significant positive effect on attitude. Attitude mediates the effect of environmental concern on purchase intention. Gender moderates the attitude-intention link.

4. Conclusion

Environmental concern matters indirectly through attitude in this fictional example.

5. Future research directions

Future studies should include government incentives and use probability sampling.
